Simplify Each Expression

~~Answers~~ 3. When we simplify an expression we operate in the following order: Simplify the expressions inside parentheses, brackets, braces and fractions bars. Evaluate all powers. Do all multiplications and division from left to right.

~~Solve equations and simplify expressions (Algebra 2 ...~~

Simplify the expression: $2 + 2x [2(3x+2) + 2]$ Solution.

First work out any terms within brackets by

multiplying them out; $= 2 +$

$2x [6x + 4 + 2] = 2 + 2x [6x + 6]$ Now eliminate the

parentheses by multiplying any number outside it; $2 +$

$2x [6x + 6] = 2 + 12x 2 +$

To simplify a radical expression, look for factors of the radicand with powers that match the index. If found, they can be simplified by applying the product and quotient rules for radicals, as well as the property $\sqrt[n]{a^n} = a$, where a is nonnegative.

~~IXL Simplify rational expressions (Algebra 2 practice)~~

After combining your like terms, construct an expression from your new, smaller set of terms. You should get a simpler expression that has one term for each different set of variables and exponents in the original expression. This new expression is equal to the first. In our example, our simplified terms are $6x$ and -2 , so our new expression is $6x - 2$. This simplified expression
