Automatically shutting off of the pump may seem like an " out-of-your-league " electric process, but actually, it ' s not an electric process at all. In fact, it is a mechanical process – and a rather innovative one at that! It involves a very interesting physical phenomenon, known as the Venturi effect. Let ' s take a closer look.

### How Does The Gas Pump Know When The Car's Tank Is Full?

It's purely mechanical -- and ingenious. Near the tip of the nozzle is a small hole, and a small pipe leads back from the hole into the handle. Suction is applied to this pipe using a venturi. When the tank is not full, air is being drawn through the hole by the vacuum, and the air flows easily. When gasoline in the tank rises high enough to block the hole, a mechanical linkage in the handle senses the change in suction and flips the nozzle off.
