Workflow automation in CloudVision permits operators to execute common deployment and configuration tasks from a single visual touch point. The portal includes a turnkey solution for Arista's Zero Touch Provisioning (ZTP) and extends that from automating initial device provisioning to also include automating ongoing change controls over the operational life cycle of the device.

Introduction to CloudVision - Arista

Configuring Port Channel LACP Failback on Arista Switches. The Port-Channel Failback mode in Arista switches allows an active LACP interface to establish a Port Channel/LAG before it receives LACP PDU's from its peer. This feature is useful in environments where customers have Preboot Execution Environment (PXE) Servers connected with a LACP Port Channel to the Ethernet switch.

The following will provide instructions on how to configure MLAG on a pair of Arista

Arista Configuration Guide

Introduction Arista CloudVision Portal (CVP) uses configlets to create configuration snippets for individual or groups of switches based on user selection. These configlets can be either static or dynamic. Static configlets include static EOS CLI configuration statements as if they were right on the switch configuration file.

Set the router-id to the IP address of the Loopback0 interface configured. On Arista switches, the default BGP administrative distance is set to 200, regardless if it's eBGP or iBGP. As best practice, we will set the eBGP distance to 20, and keep iBGP distance at 200, giving preference to the eBGP routes. # spine1.
