Description. This is the ideal resource for all those requiring an authoritative and up-to-date review of imaging appearances of diseases of the lung, pleura and mediastinum. Chest radiography and CT are integrated with other imaging techniques, including MRI and PET, where appropriate. The clinical and pathologic features of different diseases are provided in varying degrees of detail with more in depth coverage given to rarer and less well understood conditions.

Ultrasonography, computed tomography (CT), and magnetic resonance imaging (MRI) are widely used and appropriate imaging modalities for evaluation of the gallbladder. Ultrasonography is the first screening and diagnostic tool of gallbladder disease because it is easy to perform. It is superior to diagnose and detect polyps or gallstones.

Preamble. Aortic pathologies are numerous, presenting manifestations are varied, and aortic diseases present to many clinical services, including primary physicians, emergency department physicians, cardiologists, cardiac surgeons, vascular surgeons, echocardiographers, radiologists, computed tomography (CT) and magnetic resonance (MR) imaging (MRI) imagers, and intensivists.

The imaging manifestations of small airways disease on CT/HRCT may be direct or indirect signs of small airway involvement and include centrilobular nodules and branching nodular (tree-in-bud) opacities, or the demonstration of mosaic attenuation that is typically exaggerated on expiratory CT. Some disease entities have distinguishing clinical, pathologic, and/or imaging features that facilitate a more accurate diagnosis.

We review the imaging appearance of connective tissue diseases of the head and neck. Bilateral sialadenitis and dacryoadenitis are seen in Sjögren's syndrome; ankylosis of the temporo-mandibular joint with sclerosis of the crico-arytenoid joint are reported in rheumatoid arthritis and lupus panniculitis with atypical infection are reported in patients with systemic lupus erythematosus.

Imaging of Connective Tissue Diseases of the Head and Neck

A number of imaging technologies are integral to the diagnosis and management of acute thoracic disease. Some, such as the chest radiograph, are as old as the field of radiology itself.

Molecular imaging with positron emission tomography (PET) and single-photon emission computed tomography (SPECT) is increasingly used to diagnose, characterize, and monitor disease activity in the setting of inflammatory disorders of known and unknown etiology. These disorders include sarcoidosis, atherosclerosis, vasculitis, inflammatory bowel disease (IBD), rheumatoid arthritis (RA), and degenerative joint disease.

Imaging is an essential non-invasive tool for building disease understanding and characterization. Contrast agents or targeted imaging (molecular imaging) allow specific features to be delineated, such as vascularization, abnormal metabolism, or disease-specific biomarkers. GE Research has an active program developing molecular imaging agents that benefits from our strong capabilities in diagnostic imaging hardware and histopathological technology for characterization of biomarkers in diseased ...

Abstract. Near-infrared (NIR) fluorescence imaging has improved imaging depth relative to conventional fluorescence imaging in the visible region, demonstrating great potential in both fundamental biomedical research and clinical practice. To improve the detection specificity, NIR fluorescence imaging probes have been under extensive development. This review summarizes the particular application of optical imaging probes with the NIR-I window (700–900 nm) or the NIR-II window (1000–1700 ...
