capacity to control mental images may be preserved in the face of psychopathology. In the present study, we examine the relation of image control to the physiological reaction of PTSD and non-PTSD participants under two tasks. These tasks involve the manipulation of mental imagery:

Abstract Psychophysiological response to fear memory imagery was assessed in specific phobia, social anxiety disorder, panic disorder with agoraphobia, post-traumatic stress disorder (PTSD), and healthy controls. Heart rate, skin conductance, and corrugator muscle were recorded as participants responded to tone cues signaling previously memorized descriptor sentences.

Hence it can be the psychological component that triggers the stress response. If a person perceives that they are in threatening situations that they are unable to cope with, then messages are carried along neurones from the cerebral cortex (where the thought processes occur) and the limbic system to the Hypothalamus.

Serving to bridge the gap between differing approaches to psychology, this new text provides some of the most compelling evidence yet for the subjective presence and objective efficacy of the mental image. In this day and age of "dissociation" between physiological psychologists and other psychologists, between cognitive scientist and mentalist, between researchers and practitioners, mental imagery and its psychophysiology pose some intellectually "sticky" problems - and some promising resolutions - that should bind together differing disciplines within psychology.

Our ability to be conscious of the world around us is often discussed as one of the most amazing yet enigmatic processes under scientific investigation today. However, our ability to imagine the world around us in the absence of stimulation from that world is perhaps even more amazing. This capacity to experience objects or scenarios through imagination, that do not necessarily exist in the world, is perhaps one of the fundamental abilities that allows us successfully to think about, plan, run a dress rehearsal of future events, re-analyze past events and even simulate or fantasize abstract events that may never happen. Empirical research into mental imagery has seen a recent surge, due partly to the development of new neuroscientific methods and their clever application, but also due to the increasing discovery and application of more objective

methods to investigate this inherently internal and private process. As the topic is cross hosted in *Frontiers in Perception Science* and *Frontiers in Human Neuroscience*, we invite researchers from different fields to submit opinionated but balanced reviews, new empirical, theoretical, philosophical or technical papers covering any aspect of mental imagery. In particular, we encourage submissions focusing on different sensory modalities, such as olfaction, audition somatosensory etc. Similarly, we support submissions focusing on the relationship between mental imagery and other neural and cognitive functions or disorders such as visual working memory, visual search or disorders of anxiety. Together, we hope that collecting a group of papers on this research topic will help to unify theory while providing an overview of the state of the field, where it is heading, and how mental imagery relates to other cognitive and sensory functions.

"Since psychology undertook to call itself a science, there has existed a strong desire to connect the facts of the mind with the facts of bodily movement. The excuse which the present essay would offer for its own existence is that while the facts of attention, perception, and emotion have had their relation to bodily movement fully discussed, there still remain many phenomena connected with the complexer life of the mind, the revival of past experiences and the construction of new thoughts and ideas, whose connection with motor processes has not been satisfactorily traced. This book seeks to connect movement, the ultimate facts of physical sciences, with the domain of mental imagery, the world of imaginary objects."--Introduction.

The current book presents select proceedings from the Eleventh Annual Conference of AASMI (The American Association for the Study of Mental Imagery) in Washington, DC, 1989, and from the Twelfth

Annual Conference of AASMI in Lowell and Boston, MA, 1990. This presentation of keynote addresses, research papers, and clinical workshops reflects a broad range of theoretical positions and a diverse repertoire of methodological approaches. Within this breadth and diversity, however, four aspects of the nature of imagery stand out: its mental nature, its private nature, its conscious nature, and its symbolic nature. The mental nature of imagery--i.e., its epistemological aspect--is explored in the book's first section of articles by Marcia Johnson, Laura Snodgrass, Leonard Giambra and Alicia Grodsky, Vija Lusebrink, Selina Kassels, Helene Rosenberg and Yakov Epstein, M. Elizabeth D'Zamko and Lynne Schwab, and Laurence Martel. These first eight articles fall, essentially, into various domains of cognitive psychology, including the psychology of art and educational psychology. In the second section, the private nature of imagery is studied by Ernest Hartmann, Nicholas Spanos, Benjamin Wallace, Deirdre Barrett, John Connolly, James Honeycutt, Dominique Gendrin, and James Honeycutt and J. Michael Gotcher. These studies, which fall within the realm of personality and social psychology, bring to light the fact that many very public interpersonal behaviors reflect very private images. Such behaviors range from interpersonal rapport with a hypnotist, to rapport with a forensic jury.

"This book, the first of its kind, examines three main aspects of mental imagery. Providing a state of the art review of this field of research, along with in-depth reviews, meta-analyses, and research syntheses, this book will be important for those in the fields of cognitive neuroscience, physiology, and rehabilitation." --Book Jacket.

manifold complexity uniquely in human beings? This handbook reflects on such questions by collecting perspectives on imagination from leading experts. It showcases a rich and detailed analysis on how the imagination is understood across several disciplines of study, including anthropology, archaeology, medicine, neuroscience, psychology, philosophy, and the arts. An integrated theoretical-empirical-applied picture of the field is presented, which stands to inform researchers, students, and practitioners about the issues of relevance across the board when considering the imagination. With each chapter, the nature of human imagination is examined - what it entails, how it evolved, and why it singularly defines us as a species.

Excerpt from Movement and Mental Imagery: Outlines of a Motor Theory of the Complex Mental Processes The first debt of gratitude which I have to acknowledge in completing this book is to the Trustees of Vassar College, who have authorized the publication of the series to which the book belongs, in commemoration of the fiftieth anniversary of the opening of the college. I wish that I had a better contribution to offer in honor of my Alma Mater. My second debt is to my colleague, Dr. Elizabeth L. Woods, who by generous sacrifice of time has read through the whole manuscript and suggested many improvements. Although the problems considered in this essay are of a technical rather than a popular character, I have tried so to present them that a reader without psychological training could follow the discussion. No topic dealt with in the book is treated in anything like an exhaustive manner. It is only fair to say, however, that if all the reading which was done in direct connection with its composition were represented in the list of references at the end, that list would be three times as long as it is. I have not aimed at a thorough presentation of the literature of my subject, but simply at an outline development of my own views. The psychological reader will miss references to Kostyleff's *Le mecanisme cerebral de la pensee* (Paris,

1914) The omission is intentional. The book did not appear until the framework of my theory had been erected. I have felt that any adequate discussion of the theories of others would occupy space which might better be given to the consideration of the bearing of facts on my own views.
